## SDOH Work

quick “exploration” of distributions of the three (plus) variables we are “correlating”

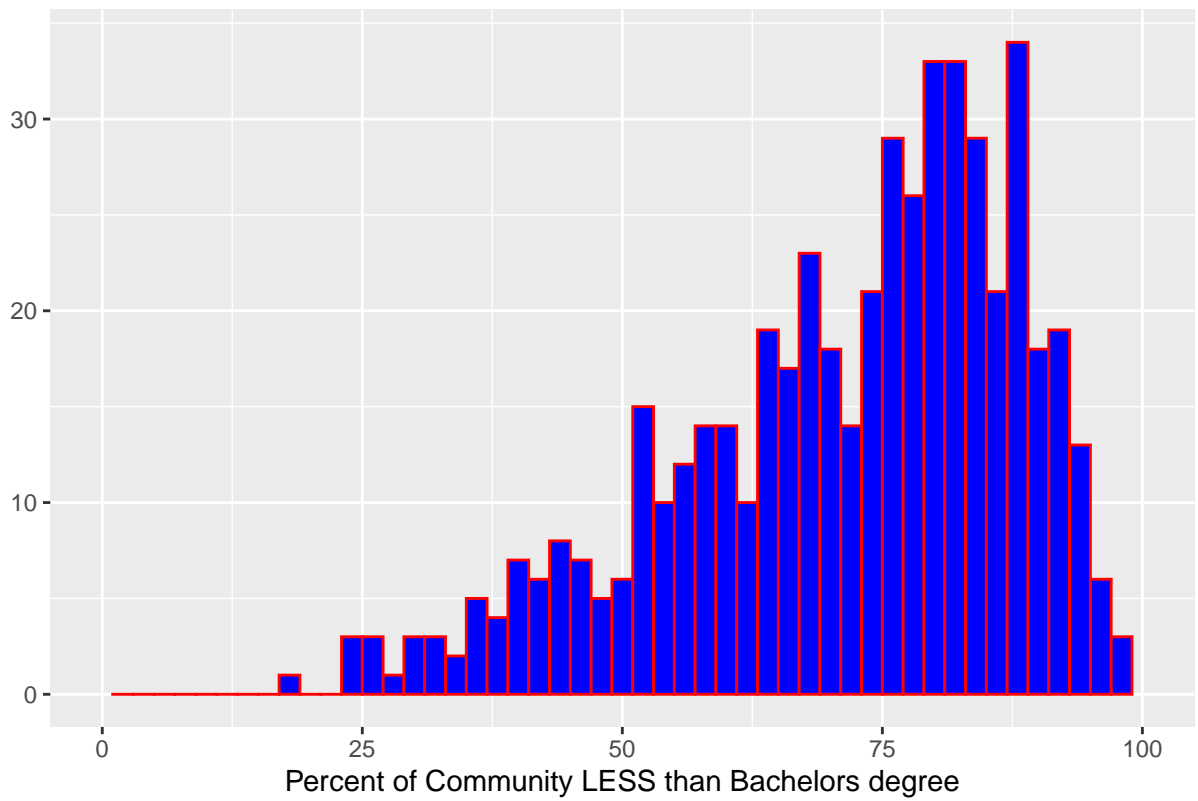

histograms to look at the distribution of each

- community poverty and education from 2017 5-year ACS data, so covers 2013-2017; education is for population 25 and older
- community homicide is age-adjusted rate for 2013-2017 data combined, 39 (of 561) communities missing data, mostly do to cell suppression

Histogram – Community Poverty

Histogram – Community Education

Histogram – Community Homicide Rate

**observations:**

- poverty - normal-ish, slight right skew (can't be smaller than 0 or larger than 100)
- education - skewed left
- homicide - strong skew right

now looking at the “raw” associations

- appears to have strong linear association, but “spread” increasing with poverty (transform?)

- non-linear relationship - log-linear (i.e. exponential) explore transformation;
- explore difference in pattern between poverty and education with homicide

check that this is not a coding error with education by comparing “our” ACS data pull to HPI

- not a coding error (lack of exact correlation is from different years of data)

“added value” exploration with:

- linear modeling lines
- color based on CHANGES in homicide rates
- dot size based on number of homicides
- very messy pop-up to get county/community name

Scatterplot of Community Poverty Level by Community Homicide Rate, 201

Scatterplot of % in Community < Bachelors Degreee by Homicide Rate, 201
